ABSTRACTED-PUB-NO: JP 68020265B

BASIC-ABSTRACT:

Shaped polyamide articles are conjugate spun from a polyamide dyes with a 1,2 type metal complex salt dye as the core and a non-dyes polyamide as sheath.

The 1,2 metal complex salt dye has the general formula where R_{1,2,3,4} are H, -R, -SO₂CH₃, -NHCOR₁ -NR₂ or halogen. R = alkyl group. M is transition metal and A is residual benzene or naphthalene group.

TITLE: Geogrid composed of polyethylene
terephthalate and
polyolefin bicomponent fibers

----- KWIC -----

Brief Summary Text - BSTX (7):

U.S. Pat. No. 3,616,183 discloses sheath-core
filaments preferably with a
polyethylene terephthalate core and a copolyester sheath of
ethylene
terephthalate/polyoxyethylene terephthalate. After
subjecting the sheath-core
filaments to a dyeing procedure, a treatment removes the
dyestuff from the
sheath of the filaments so the lack of dye-fastness and the
lack of light
resistance normally associated with the presence of
dyestuff in the material of
which the sheath is composed is no longer a problem.
